

Books of related interest  
from Wright-Allen Press:

**World Dynamics**

by Jay W. Forrester

*World Dynamics* interrelates population, industrialization, natural resources, food, crowding, and pollution to present an exploratory theory of man in the world ecology. The book is the first step toward adapting the principles of system dynamics to the behavior of the forces involved in determining the transition from growth to world equilibrium. It has been adopted in many colleges and universities for teaching courses in such diverse fields as geology, zoology, life sciences, political science, ecology, and cybernetics. A new chapter on the physical and social limits to growth has been added in this second edition.

1973, second edition, 144 pp., ill., \$9.75

**Principles of Systems**

by Jay W. Forrester

*Principles of Systems* introduces the basic concepts of structure in dynamic systems and leads into the way structure determines behavior. The book serves as a starting point for teaching dynamic systems in multidisciplinary courses on urban, ecological, corporate, and other social systems. It is an excellent study complement to other books treating social systems.

1968, 392 pp., ill., \$8.00 paperback

**Collected Papers of Jay W. Forrester**

edited by Jay W. Forrester

The collection consists of 17 of Professor Forrester's papers written since 1958 on system dynamics and its applications. The papers lead the reader from early applications of system dynamics in industry to present use of the methodology in urban and national policy design. The chronological organization of the papers provides a historical perspective of the development of the field of system dynamics.

Fall 1974, approx. 350 pp., ill., \$18.00

**The Life Cycle of Economic Development**

by Nathan B. Forrester

This book presents a system dynamics model of national economic development. It interrelates the five production sectors (agriculture, goods, services, resources, and capital) of a national economy to examine the shifting allocation of labor and capital between these sectors as development progresses. The book analyzes various possible modes of economic development for an industrial economy, and the effects of different development strategies. Complete details of the computer model are included to enable the reader to extend the study. The book also illustrates the use of system dynamics in national policy planning.

1973, second edition, 194 pp., ill., \$20.00

**Dynamics of Commodity Production Cycles**

by Dennis L. Meadows

Professor Meadows finds the classical Cobweb Theorem and its modifications to be inadequate representations of dynamic relationships in actual commodity systems. Employing the system dynamics methodology, he develops a general dynamic model of the economic, biological, technological, and psychological factors which lead to the instability of commodity systems. With appropriate parameter values, the general model explains the hog, cattle, and chicken cycles observed in the real world. Experimental simulations of the model present surprising implications for current stabilization policies.

1970, 104 pp., ill., \$14.75

**Toward Global Equilibrium: Collected Papers**

edited by Dennis L. Meadows and Donella H. Meadows

This volume contains 13 papers which describe individual research on dynamic issues evolving from the Club of Rome project reported in *The Limits to Growth*. It presents detailed analyses of several important global problems, e.g. DDT and mercury pollution, natural resource depletion, solid waste disposal, etc. and provides policy suggestions which may alleviate these problems. It also examines the economic, political, and ethical implications of growth and the transition to equilibrium.

1973, 358 pp., ill., \$18.00
