

4-27	Fraction of industrial output allocated to agriculture table	288	4-68	Fraction allocated to land maintenance table	333
4-28	Sample land development costs	290	4-69	Run 4-1: historical run	334-335
4-29	Development cost per hectare table	291	4-70	Run 4-2: standard run	336-337
4-30	Changing patterns of input use in U.S. agriculture, 1910-1960	293	4-71	Standard, pessimistic, and optimistic estimates of the land yield multiplier from capital table	339
4-31	Value of agricultural inputs in 1962 and proposed levels for 1985, selected developing regions (millions of 1962 dollars)	294-295	4-72	Run 4-3: sensitivity test of the land yield multiplier from capital table, using the optimistic LYMCT	340
4-32	Agricultural inputs per hectare for selected developing regions, 1962, and proposed levels for 1985	295	4-73	Run 4-4: sensitivity test of the land yield multiplier from capital table, using the pessimistic LYMCT	342
4-33	Historical wheat yields in the United States	296	4-74	Run 4-5: sensitivity test with a 35 percent increase in the estimate of the value of potentially arable land total	343
4-34	Yield "take-off" for wheat and rice	296	4-75	Run 4-6: sensitivity test with a 25 percent decrease in the estimate of the value of potentially arable land total	344
4-35	Yield and fertilizer use	297	4-76	Run 4-7: sensitivity test with a 35 percent increase in the estimate of the value of potentially arable land total and development costs adjusted to maintain historical behavior	345
4-37	Estimated losses to insect, disease, and weed pests in production of selected crops in the United States, 1951-1960	298	4-77	Run 4-8: sensitivity test with a 35 percent increase in the estimate of the value of potentially arable land total and a 50 percent increase in the upper limit of the land yield multiplier from capital	346
4-38	Global preharvested losses of corn, wheat, and rice, 1965	298	4-78	Run 4-9: sensitivity test with a 25 percent decrease in the estimate of the value of potentially arable land total and a 25 percent decrease in the upper limit of the land yield multiplier from capital	347
4-39	Yield responses of different seed varieties to fertilizer use	299	4-79	Standard, pessimistic, and optimistic estimates of the development costs per hectare table	348
4-40	Yield and proportion of crop in improved varieties, 1948-1952 and 1960-1962	300	4-80	Standard, pessimistic, and optimistic estimates of the land life multiplier from yield table	349
4-41	Yield and power availability	301	4-81	Standard, pessimistic, and optimistic estimates of the land yield multiplier from air pollution table	349
4-42	Global use of fertilizers (million tons per year)	302	4-82	Run 4-10: sensitivity test with optimistic estimates of the cost of land development, the adverse effects of air pollution on yield, and the extent to which high land yield causes land erosion	351
4-43	Pesticide usage in metric tons of active ingredients, by class and geographic area, 1963	303	4-83	Run 4-11: sensitivity test with pessimistic estimates of the cost of land development, the adverse effects of air pollution on yield, and the extent to which high land yield causes land erosion	352
4-44	Power availability by geographic area, 1964-1965	304	4-84	Run 4-12: policy run in which the impairment of land fertility from persistent pollutants is completely eliminated in 1975	353
4-45	Inputs needed to increase average yield	304	4-85	Run 4-13: policy run in which the adverse effects of air pollution on land yield and the impairment of land fertility by persistent pollutants are completely eliminated in 1975	355
4-46	Proposed future yield and input consumption for the developing world	305	4-86	Run 4-14: policy run in which efforts to combat land erosion are initiated in 1975, in addition to the previous policies that eliminate the adverse effects of air pollution and persistent pollution	356
4-47	Relation between land yield and agricultural inputs per hectare	305	4-87	Run 4-15: policy run in which the land required for urban and industrial use is reduced to 25 percent of expected requirements, in addition to the previous policies that combat land erosion and eliminate the adverse effects of air pollution and persistent pollution	357
4-48	Land yield multiplier from capital table	306	4-88	Run 4-16: equilibrium run in which the exogenous inputs level off in the year 2050	358
4-49	Economic loss of crops caused by air pollution in Los Angeles County, 1949	308	4-89	Run 4-17: equilibrium run in which the exogenous inputs level off in the year 2025	360
4-50	Air pollution levels in nonurban and different sized urban areas in the United States, 1969-1970	309	4-90	Run 4-18: equilibrium run in which the exogenous inputs level off in the year 2000	361
4-51	The development through time in Scandinavia of the deposition of excess acid through precipitation during one year	309	5-1	The geologic availability of world nonrenewable resources	372-373
4-52	Land yield multiplier from air pollution table	310	5-2	Exponential growth in world production of nonrenewable resources	374
4-53	Fraction of investment allocated to land development table	311	5-3	Declining grade of copper ore mined and declining returns to exploratory drilling for crude oil	375
4-54	Marginal land yield multiplier from capital table	313	5-4	U.S. minerals: output, labor and capital inputs, and cost per unit of product, 1870-1957	376
4-55	Changes in land utilization, 1882-1952	315			
4-56	Soil losses due to water erosion under different soil treatments	316			
4-57	Land life multiplier from yield table	318			
4-58	U.S. population and urban area	320			
4-59	Urban-industrial land per capita in the United States	320			
4-60	Urban-industrial land per capita table	321			
4-61	Soil organisms in well-cultivated soil	324			
4-62	Land fertility degradation rate table	326			
4-63	The influence of soil treatment on organic matter	327			
4-64	The decline of fertility of some Northern Rhodesian soils under continuous cultivation of maize without manure or fertilizers	327			
4-65	Amounts of nutrients in soil and vegetation	328			
4-66	The adjustment of land fertility equilibria	330			
4-67	Land fertility regeneration time table	331
