

6-37	Run 6-10: behavior of the pollution sector in response to a doubling of the persistent pollution transmission delay in 1975	468	7-21	Run 7-16: resource, pollution, and land yield technologies	520
6-38	Run 6-11: behavior of the pollution sector in response to an advance in persistent pollution assimilation technology in 1975	469	7-22	Run 7-17: resource, pollution, and agricultural technologies	521
6-39	Run 6-12: behavior of the pollution sector in response to a 50 percent increase in human health and land fertility technology in 1975	470	7-23	Run 7-18: exponential changes in technology	523
6-40	Run 6-13: behavior of the pollution sector in response to a sudden increase in persistent pollution generation control technology in 1975	471	7-24	Run 7-19: adaptive technological policies—no delays, no costs	526
6-41	Run 6-14: behavior of the pollution sector in response to adaptive persistent pollution generation control technologies when the persistent pollution transmission delay is assumed to be 20 years	472	7-25	Structural additions for adaptive technological policies	527
6-42	Causal-loop diagram of the structural additions designed to test the effects of adaptive persistent pollution generation control technologies	472	7-26	Run 7-20: adaptive technological policies—the effects of limitations to technological capabilities	528
6-43	Run 6-15: behavior of the pollution sector in response to adaptive persistent pollution generation control technologies when the persistent pollution transmission delay is assumed to be 2 years	473	7-27	Run 7-21: adaptive technological policies—the effects of technological development and implementation costs	529
6-44	Run 6-16: behavior of the pollution sector when persistent pollution generation stabilizes in the year 2000	474	7-28	Structural additions for adaptive technological policies with development and implementation costs	530
6-45	Run 6-17: behavior of the pollution sector when persistent pollution generation stabilizes in the year 2020	475	7-29	Assumed costs of technological development and implementation for adaptive technological policies	531
6-46	Run 6-18: behavior of the pollution sector when adaptive persistent pollution generation control technologies are combined with material equilibrium in the year 2020	476	7-30	Run 7-22: adaptive technological policies—the effects of delays and costs of technological development and implementation	532
7-1	DYNAMO flow diagram of the world model	490–491	7-31	Structural additions for adaptive technological policies with delays and costs of technological development and implementation	533
7-2	Run 7-1: population sector behavior, 1900–1970	492	7-32	Run 7-23: adaptive technological policies—the effects of delays and costs, with a bias for continued growth in industrial output per capita	535
7-3	Run 7-2: capital sector behavior, 1900–1970	494	7-33	Structural additions for adaptive technological policies with a bias toward growth in industrial output per capita	536
7-4	Run 7-3: agriculture sector behavior, 1900–1970	496	7-34	Run 7-24: reduction of the desired completed family size	539
7-5	Run 7-4: nonrenewable resource sector behavior 1900–1970	497	7-35	Run 7-25: increase of industrial and service capital lifetimes	540
7-6	Run 7-5: persistent pollution sector behavior, 1900–1970	499	7-36	Run 7-26: shift in the choice of output forms	541
7-7	Run 7-6A: World3 reference run	501	7-37	Run 7-27: population policy and shift of output choices	542
7-8	Run 7-6B: capital sector variables from the reference run	502	7-38	Run 7-28: equilibrium through discrete policy changes	544
7-9	Run 7-6C: agriculture sector variables from the reference run	503	7-39	Run 7-29: equilibrium through adaptive policies	546
7-10	Run 7-7: sensitivity of the initial value of nonrenewable resources to a doubling of NRI	505	7-40	Structural additions to achieve equilibrium through adaptive technological and social policies	547
7-11	Run 7-8: sensitivity of the initial value of nonrenewable resources to a ten-fold increase in NRI	506	7-41	Run 7-30: stabilization policies introduced in the year 2000	549
7-12	Increase in the slope of the fraction of industrial output allocated to agriculture relationship for sensitivity test	507	C-1	Example of a DYNAMO flow diagram	596
7-13	Run 7-9: sensitivity of the fraction of industrial output allocated to agriculture	507	D-1	Example of DYNAMO equations	598
7-14	Run 7-10: sensitivity of the average lifetime of industrial capital	508	E-1	Standard run for the nonrenewable resource sector	603
7-15	Run 7-11: sensitivity of the average lifetime of industrial capital and the industrial capital-output ratio	509	E-2	Scaling letters used in DYNAMO	604
7-16	Run 7-12: improved resource exploration and extraction technologies	513	F-1	Response of a first-order information delay to a sinusoidal input	606
7-17	The effects of resource exploration and extraction technologies on the fraction of capital allocated to obtaining resources	513	F-2	DYNAMO flow diagram representation of first- and third-order information delays	607
7-18	Run 7-13: recycling technologies	514	F-3	Response of first- and third-order delays to pulse, step, and ramp inputs	608–609
7-19	Run 7-14: resource and air pollution control technologies	517	F-4	DYNAMO flow diagram representation of first- and third-order material delays	609
7-20	Run 7-15: resource and pollution technologies	518
