

2-28	Lifetime multiplier from food table	67	2-71	Family response to social norm table	122
2-29	Famines and mortality in medieval France	68	2-72	Total fertility versus GNP per capita, United States, 1870–1940	124
2-30	Health expenditures per capita versus service output per capita	69	2-73	Use-effectiveness of various fertility control methods	130
2-31	Health services allocations per capita table	70	2-74	Cost-effectiveness curves for birth-control methods	131
2-32	Health services impact delay	71	2-75	Fraction of service output allocated to fertility control table	132
2-33	Health services per capita versus life expectancy	72	2-76	National family-planning expenditures	133
2-34	Lifetime multiplier from health services, 1900, 1966, 1990	73	2-77	Fertility control effectiveness table	134
2-35	Mortality trends in Sweden and various nonindustrialized countries	74	2-78	DYNAMO flow diagram, four-level age structure	137
2-36	Mortality trends in Latin America	75	2-79	Initial values for population levels in age disaggregations	138
2-37	Hysteresis in lifetime multiplier from health	75	2-80	Age-specific mortality rates, Norway and Mauritius	139
2-38	Lifetime multiplier from health services table	76	2-81	DYNAMO flow diagram, fifteen-level age structure	142
2-39	Sigmoid growth curves	77	2-82	Mortality table functions, fifteen-level age structure	143
2-40	Population densities and net population growth rates, 1970	79	2-83	Age-specific fertility patterns	145
2-41	Influence of crowding on life expectancy through infectious diseases	81	2-84	Run 2-1: historical behavior, 1900–1975	147
2-42	Correlation between particulate levels and death rate	82	2-85	Run 2-2: historical behavior, 1900–1975, mortality variables	149
2-43	Influence of crowding on life expectancy through local pollution	83	2-86	Run 2-3: historical behavior, 1900–1975, fertility variables	150
2-44	Influence of crowding on life expectancy through social stress	84	2-87	Run 2-4: constant low income	150
2-45	Influence of crowding on life expectancy as represented in World3	85	2-88	Run 2-5: constant high income	151
2-46	Urbanization versus GNP per capita, 1965	86	2-89	Run 2-6: constant low income, improved health care	152
2-47	Global urbanization as a function of time	87	2-90	Run 2-7: exponential economic growth	153
2-48	Patterns of urbanization in industrialized and nonindustrialized areas	88	2-91	Run 2-8: exponential economic growth, mortality variables	154
2-49	Fraction of population urban table	89	2-92	Changes in age structure during demographic transition (fifteen-level model)	154
2-50	Fraction of population urban versus population, historical and estimated	89	2-93	Run 2-9: exponential economic growth, fertility variables	155
2-51	Lifetime multiplier from crowding versus fraction of population urban	89	2-94	Run 2-10: exponential economic growth, higher childbearing age	155
2-52	Crowding multiplier from industrialization table	90	2-95	Alternate age-specific fertility assumptions	156
2-53	Possible effects of pollution on life expectancy	93	2-96	Run 2-11: exponential economic growth, perfect fertility control	156
2-54	Lifetime multiplier from pollution table	94	2-97	Run 2-12: exponential economic growth, perfect fertility control, reduced desired family size	157
2-55	Rising age-specific death rates, Norway, Sweden, and the Netherlands	95	2-98	Run 2-13: constant total output	158
2-56	Fraction of women of fertile ages in theoretical and real populations	96	2-99	Run 2-14: constant total output, perfect fertility control	158
2-57	Total fertilities, various nations, 1955–1960	98	2-100	Run 2-15: constant total output, perfect fertility control, reduced desired family size	158
2-58	Comparison of total marital fertility rates for some natural fertility populations	99	2-101	Run 2-16: constant total output, reference for sensitivity tests	159
2-59	Sterility in African populations	102	2-102	Run 2-17: equitable food distribution and nutrition education	160
2-60	Fecundity multiplier table	104	2-103	Run 2-18: maximum life expectancy of 100 years	161
2-61	Total fertilities of preindustrial societies	105	2-104	Run 2-19: greater allocations to health services	161
2-62	Comparison of model-generated maximum total fertility with observed fertilities in preindustrial societies	106	2-105	Run 2-20: no crowding effect	162
2-63	Child mortality and total fertility, India, 1959	108	2-106	Run 2-21: constant maximum total fertility	163
2-64	Rates of natural increase versus life expectancy, theoretical and empirical	109	2-107	Run 2-22: lower family size norm	164
2-65	Different assumptions for the compensating multiplier from perceived life expectancy	110	2-108	Run 2-23: constant family size norm of 3	165
2-66	Compensatory multiplier from perceived life expectancy table	111	2-109	Run 2-24: increased social adjustment delay	165
2-67	Desired family size, 1958–1964	116–117	2-110	Run 2-25: no income expectation effect	166
2-68	Desired family size versus GNP per capita	118	2-111	Run 2-26: increased compensation for perceived life expectancy	166
2-69	Family size versus income, United States, 1965	118	2-112	Run 2-27: decreased lifetime perception delay	166
2-70	Social family size norm table	120	2-113	Run 2-28: decreased fertility control effectiveness	167
